DETAILED ACTION

Drawings

The proposed drawing correction and/or the proposed substitute sheets of drawings, filed on 01 May 2002 have been disapproved. A proper drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The correction to the drawings will not be held in abeyance. The proposed drawing correction has been disapproved because it is not in the form of a pen-and-ink sketch showing changes in red ink or with the changes otherwise highlighted. See MPEP § 608.02(v).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-11 are rejected under 35 U.S.C. 102(b) as being anticipated by NEER et al.(U.S. Patent No. 5,300,031). Neer shows a syringe having a barrel, plunger with a knurled coupling element, conical front, syringe mating sections comprising an annular flange fixed to the syringe body, and an interior cavity in the coupling element (See Figs. 4,5,11,12). The coupling element is considered knurled because it includes a protuberance. The interior cavity in the coupling element is the side cavity formed by the protuberance and face of the plunger. Neer also discloses a movable face plate 127 movable by a rotatable lever 138.

Response to Arguments

Applicant argues that Neer has discontinuities in cross sections taken along the longitudinal axis (i.e., longitudinal cross sections), and that his device has no discontinuities in transverse cross sections (i.e., cross sections taken along the transverse axis). The examiner maintains the rejections because Neer also has no discontinuities in cross sections taken along the transverse axis. Additionally Neer has no discontinuities in cross sections taken along the longitudinal axis over a portion of the extension adapted to be gripped by a coupling element (Figs. 11,12).

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. DENSMORE et al. (U. S. Patent No. 5,007,904) shows a drive ram engaging coupling element with an interior cavity along a longitudinal axis.

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Art Unit: 3763

however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
